## 1 PROBLEM

(CSIR UGC NET EXAM (Dec 2012), Q.51)

Suppose  $X_1, X_2, X_3, X_4$  are i.i.d random variables taking values 1 and -1 with probability  $\frac{1}{2}$  each. Then  $E(X_1 + X_2 + X_3 + X_4)^4$  equals

- 1) 40
- 2) 76
- 3) 16
- 4) 12

## 2 SOLUTION

Using multinomial expansion for  $(X_1 + X_2 + X_3 + X_4)^4$ ,

$$\begin{aligned} (X_1 + X_2 + X_3 + X_4)^4 &= \frac{4!}{4!} \sum_{i=1}^4 X_i^4 + \frac{4!}{3!1!} \sum_{i=1}^4 \sum_{j=1(j \neq i)}^4 X_i^3 X_j \\ &\quad + \frac{4!}{2!2!} \sum_{i=1}^4 \sum_{j=1(j \neq i)}^4 X_i^2 X_j^2 \end{aligned} \quad (2.0.1)$$

Since expectation is a linear function,

$$\begin{aligned} E(X_1 + X_2 + X_3 + X_4)^4 &= \sum_{i=1}^4 E(X_i^4) + 4 \sum_{i=1}^4 \sum_{j=1(j \neq i)}^4 E(X_i^3 X_j) \\ &\quad + 6 \sum_{i=1}^4 \sum_{j=1(j \neq i)}^4 E(X_i^2 X_j^2) \end{aligned} \quad (2.0.2)$$

Since  $X_i$  can only be +1 or -1,  $X_i^4$  is always 1. Hence

$$E(X_i^4) = 1 \quad (2.0.3)$$

Similarly for  $X_i^3 X_j$  term we get the following possibilities

$X_i$	$X_j$	$X_i^3 X_j$
1	1	1
-1	-1	1
-1	1	-1
1	-1	-1

Hence  $X_i^3 X_j$  has values 1 and -1 with probability  $\frac{1}{2}$  each.

$$\Rightarrow E(X_i^3 X_j) = \frac{1}{2} \times 1 + \frac{1}{2} \times -1 = 0 \quad (2.0.4)$$

$X_i^2 X_j^2$  is always 1 hence  $E(X_i^2 X_j^2) = 1$

To find the number of  $X_i^2 X_j^2$  terms,

There are 4 random variables and we need to select 2 (i and j) without any order (because  $X_i^2 X_j^2 = X_j^2 X_i^2$ )

$$\Rightarrow \text{total number of terms} = {}^4C_2 \quad (2.0.5)$$

$$= 6 \quad (2.0.6)$$

$$\Rightarrow E(X_1 + X_2 + X_3 + X_4)^4 = 4 \times 1 + 0 + 6 \times 6 \times 1 \quad (2.0.7)$$

$$= 40 \quad (2.0.8)$$

Hence option 1 is correct.
